Standard content configuration

* This output must be connected so as to drive the "snare drum" when the rhythms from 1 to 9 (see rhythm selection) are selected, and the "claves" when the rhythms from 10 to 15 (see rhythm selection) are selected.

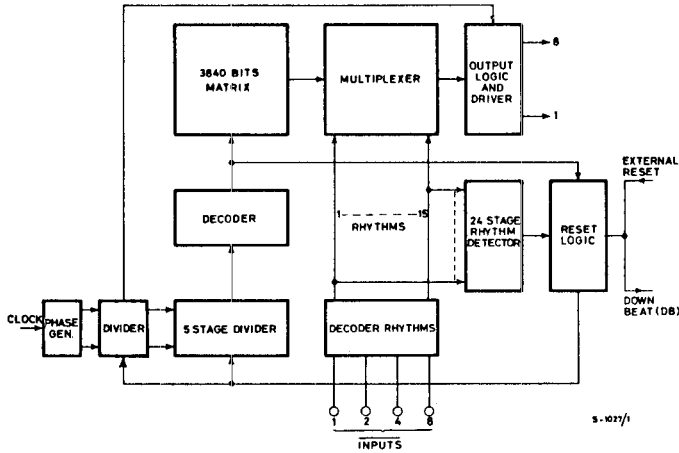

** This pin generates a down-beat trigger which can be used to drive an external lamp to indicate the start of each measure.

TIMING WAVEFORMS (positive logic)

Note: In these timing waveforms it has been assumed, for example, that in the truth table bits $n+1$ and 2 have not been programmed i.e. the musical instrument has not been introduced. All the other bits have been programmed for the introduction of the instruments.

INSTRUMENT BEATS VERSUS RHYTHM PROGRAM

* The lowering of the music signals depends on the intrinsic decay time of the sound generator and not on the length of the enable pulses. Each beat can therefore last for more than one elementary time

TYPICAL APPLICATIONS

Figure 1 shows the typical application of the M 252(AA).

With two M 252 devices it is possible to increase the number of rhythms or the number of instruments available, or the number of elementary times, as shown in figures 2, 3 and 4 respectively.

The use of a memory matrix allows the customer complete flexibility, since modification of the memory is quick and relatively cheap.

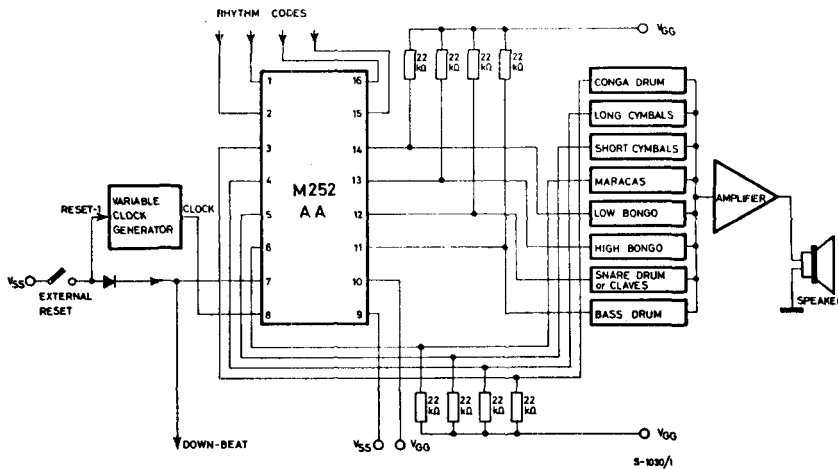

Fig. 2 - Increase in number of rhythms (positive logic)

TYPICAL APPLICATIONS (continued)

Fig. 3 - Increase in number of instruments

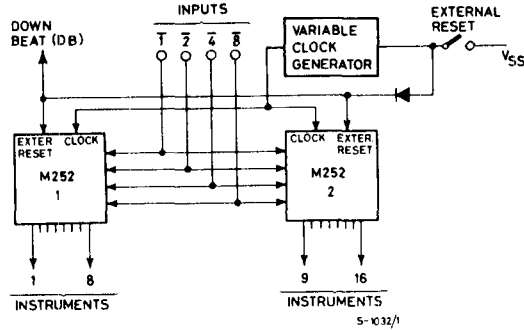

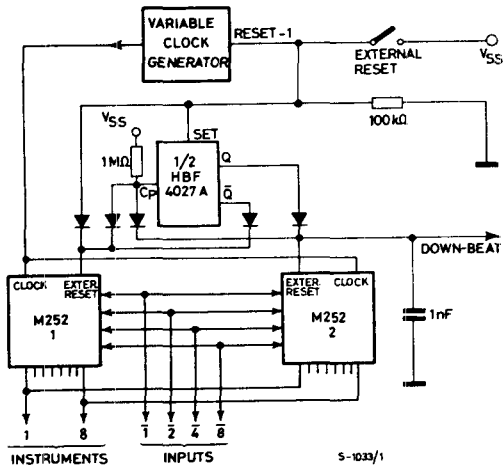

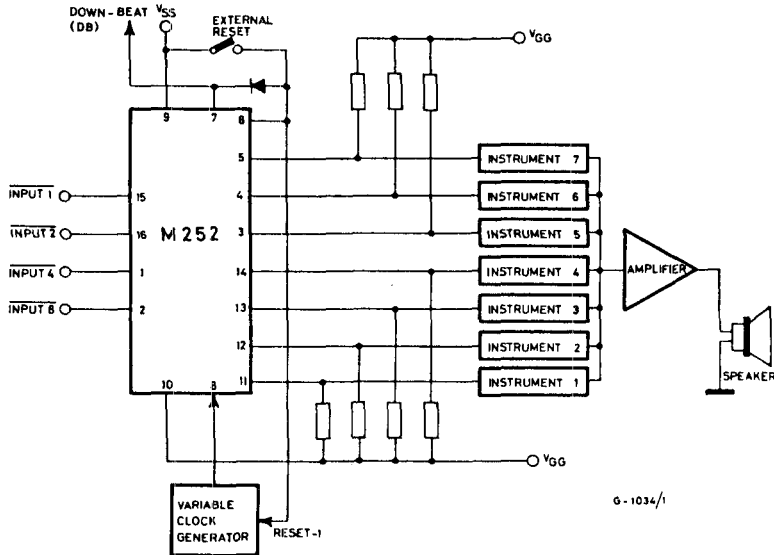

Fig. 4 - Increasing the number of elementary times

Note: The total number of elementary times is given by the sum of the elementary times of the individual devices

CIRCUIT FOR CHANGING THE NUMBER OF ELEMENTARY TIMES

To obtain a required number of elementary times "N" simply put a cross in the "N + 1" position of the column which now represents the reset output, rather than the 8th instrument. The DB output can be used as down-beat because it appears at the beginning of each measure. Since the pulse is only 2 - 3 μ s long it must, however, be stretched and buffered to enable it to drive a lamp.

Full information on the use of the M 252 in electronic organs and other applications will be found in Technical Note no. 131 available on request.

COMPLETING THE TRUTH TABLE

The ROM truth table has been organized in 32 rows which represent elementary times and 120 columns (15 groups of 8) where each group represents a rhythm which has as its disposition 8 programmable instruments. To programme each rhythm one indicates (with a cross) in the appropriate boxes the timing for each beat required for each instrument.

In the given truth table we show an example of how to programme three imaginary rhythms, the first is in 4/4 time, the second in 3/4 time and the third in different time, chosen randomly. Each cross corresponds to a beat of the indicated instrument or, in logic terms, to the presence of a "1" level (positive logic) at the output.

The absence of a cross indicates that the corresponding instrument is not used in that part of the rhythm. Rhythm 3 is an example of how to programme for a time which differs from 4/4 or 3/4. This is achieved by using output 8 to reset the rhythm and not to drive an instrument. The rhythm is valid till elementary time no. 15.
